ABSTRACT

Development of border regions is related closely to the mission of national development, especially to ensure the integrity and territorial sovereignty, defense of national security and improving people's welfare in border region. Population residing in the border region in general live in a state of backwardness and poverty, both social, economic and social life culture. It is with this need for a design that boosts well-being of border communities in terms of social, economic and cultural.

Tourist village with the concept of environmentally friendly architecture and improving the welfare of society by utilizing resources in maintaining the identity around traditional settlement areas as well as a tourist village that can be introduced to the entire Indonesian society as well as foreign tourists.

Using analytical methods, the results of the design will be strongly influenced by the process carried out previously. The process includes the setting of the problem, the field data collection, literature, typology, programming analysis, synthesis, schematic design, conceptualization and realization design. with use the concept of village tourism development zoning obtained between the core zone, buffer zones, and service zones that make the traditional village system be structured and coordinated. expected development activities in the border area can be carried out directed, integrated, effective and efficient, providing innovative design of environmentally friendly tourist village to the border regions and communities based on local resources, the Indonesian community and tourists

Key words : Development of Border Areas, Sustainable Tourism Village.
