ABSTRACT

In the Beginning, Gorontalo city shoreside settlement in pohe has a special character as a fishing village. However, in three periods of government, morphological transformation occurs and changed the character of pre-existing. Transformations that occur in the study sites were dominated by the process of compaction of the building, so the rule change is not clearly known. The cause of these transformations can be indicated as a cause of government policy and natural growth factor i.e. change of population, topography, Socio-cultural society, and economics.

This research is used to describe changes in morphology or structure within the scope of settlements and buildings. Arrangement based on this scope restricted in the aspects of settlement patterns, accessibility, building use, and building orientation. This research is descriptive qualitative and supported by change of quantitative data. The method of analysis using diachronic and synchronic to investigate rules and stimulant factors the transformation of the seaside settlement arrangement from 1970 until 2010.

The transformations in pohe settlement were inside compaction. Most of them lead to the formation of new settlements. In addition, the factor of government policy was very dominant influence the order of transformation that occurred in the study locations. This policy, development of infrastructure of roads and bridges, have affected growing and changing settlement patterns and shift of accessibility. In effect, the Pohe’s population began to grow and change their orientation and activities from the sea into the land. In addition, the developing of Wisata Tangga 2000, in the end, encourage the transformation of the settlement arrangement. Changes in population, social conditions and topography are also advocated factor that is as well as important influence on the pohe settlement transformation.
