ABSTRACT

The discrepancy on development is becoming a global issue to which Kruznet (1954) considered it as natural for developing country. But it still becomes a problem faced in development. In Pamekasan regency, some developed regions comparing to the others sign discrepancy on economy development.

Through identification of the discrepancy on economy development area, it can be found the causes of the discrepancy and its directive distribution. This research has an objective to find out the directives distribution of economy development area in Pamekasan regency. This research applies positivistic approach with qualitative design. The searcher collects empirical data and explains them theoretically related to the process of distributing economy development area.

The components of the discrepancy of economy development area include demography, labor, income, poverty, PDRB, and economy infrastructures in every sub-district. The researcher, then, did numerical computation by Williamson Index Formula. It is found that there are three sub-districts in which the components of the discrepancy appear. Those sub-districts are Proppo, Pamekasan and Batumarmar.

By Delphi analysis, the researcher finds out four causes of discrepancy and four directives on economy distribution in Pamekasan regency. The four causes are: 1) the lowness of human resources quality, 2) the difference on demography among sub-districts, 3) the lowness of mobility production factors, and 4) the difference on natural resources. The directives of the distribution involve: 1) improving the human resources quality through formal and non-formal education such as workshops (BLK), 2) developing small enterprises (UKM), 3) making policies on transmigration from high populated area to less populated area, and 4) exploiting and making use of natural resources appropriately and continuously.
