ABSTRACT

The development of communication technology and the world now has all the work done quickly and efficiently. Of course the impact on the development of the use of a computer, a user that is not faced with difficulty when the computer will be used for home use, while the situation is not possible for it.

With advances in technology have supported the network with wireless internet, especially mobile communication technology. In addition, this technology has touched almost all circles in India and can be obtained easily. Moreover, with the Java 2 Micro Edition (J2ME) by Sun Microsystems, create more and more mobile applications are developed at this time.

Through the end of this project, built a J2ME application that can perform on a remote personal computer with the GPRS technology. With support for GPRS services and J2ME applications, is expected to assist a user in accessing the computer is located far away, so it can improve the performance of a user who uses the computer.
