

ABSTRACT

Email is one of those facilities that are often used because it provides an easy and quick way of sending an information. By using an email client, people can access email easily and quickly. Community needs in the use of email is supported by the development of rapid information technology has placed the mobile devices, particularly mobile phone as an efficient communication tool for accessing, storing and processing information. An email can be accessed anywhere using a mobile device media is one of the options that have a substantial benefit, because the benefits will email itself that are often accessed by users to communicate with each other.

This final project is to make an email client that can run on mobile devices with Java support and GPRS connections. With this application, users can access and manipulate messages stored on the POP3 and IMAP servers. Access and manipulation that can be done, among others, see the list of messages, read messages, delete messages, and storing messages. In addition, users can also send messages via SMTP server.
