Abstract

Social networking is a site that everyone can create personal web pages, then connect with friends to share information and communicate. For now, the largest social networking are Facebook and Twitter. For users of both sites, sometimes it bother to open the windows to gain access to both sites simultaneously.

Both of these social networking provides an API that can be used to build applications that can access the site. By using API, software developers can build an application that can access the features of both sites without opening a browser.

The final project is to build desktop-based client application by utilizing Facebook and Twitter API (Application Programming Interface) as a feature of data communication to both sites. By using this application, user can use a variety of activities like at Facebook and Twitter sites.

Keyword: Social Networking, Desktop Application, Facebook API, Twitter API
