ABSTRACT
Dental health has always been a health issue that is often forgotten by most of our society. Equal distribution of dental health services at community health centers for middle to lower barriers are still experiencing the lack of facilities. Answering this need was born the concept of economies of the Dental Unit. The main function of dental unit is as an economic concept to reach out community needs in health care facilities in the dental clinic. The method used is to see references to dental units equipped with super facilities compared with the dental unit standard but answering the needs of health center service standards. By minimizing the material and the required mechanical systems are expected to summarize the cost so it can accommodate the needs of the dental clinic to purchase a new unit. 

The end result of this final project is to form a special unit design dental clinic dedicated to the concept of economies of East Java, to meet the needs of health centers with service standards and approaches that have been studied and analyzed on the basis of issues and service needs for the targeted segment.
