ABSTRACT

The presence of medical rehabilitation facility as one of the health-care facilities for the community is very needed. It’s can be an integrated service facilities to speed up the recovery of organ malfunction as a supporter of efforts to cure health problems. As a public building that serve many people, medical rehabilitation facility of RSUD dr. Soetomo Surabaya require many resources, giving rise to many negative effects on the environment. Energy waste is one example of a negative effect. So far the application of interior design has not been too much attention to give comfort to its facility.

With these considerations needed an interior design plan for medical rehabilitation facility of RSUD dr. Soetomo Surabaya with environmentally friendly concepts on the one hand and provide comfort for the user space on the other hand, also can communicate the image and vision of medical rehabilitation facility of RSUD dr. Soetomo Surabaya.

Design methods used include data collection carried out directly or indirectly. Surveys and observations directly into the field to find out what is needed in facilities. While the study of literature, magazines, and internet about medical rehabilitation and it’s needs to get comparable data, standards for design, development and design of the object reference is required.

The expected outcome of this, is to designing the interior design of medical rehabilitation in Dr. Soetomo public hospital that could benefit the wider community.
