ABSTRACT

Web including one of the Internet technology that is rapidly growing at this time. By using this technology, anyone can provide data or information over the web. To facilitate the provision of data or information required of a web-based application that functions in terms of accessing the data or information available that can take place quickly, efficiently and accurately.

In this final project will be created a web based application using PHP and MySQL database. It will also discuss how the presentation of data and information about the company, either on renewal product, service, client or other important information. Besides, the presentation of goods and services order form. The methods used to collect data both with observational methods, methods of literature, and the next step is to design the program.

From the making of this application is expected for those users could get a satisfactory service at the time of ordering goods and services performed. In addition users can also obtain information that has been provided by the administrator. Available information is always updated so that users always get accurate information.
