ABSTRACT

One of the processes of logistics are the shipping process. Shipping using containers are a main choices until this day, due to the ease of cargo handling, shipping using a container is considered secure and safe. yet the high cost of shipping has become an important problem to solve to ensure the success of the national logistic development blue print.

On each and every step of cargo shipment, there are costs that exists from the tariff that has been established starting from the stuffing process until the stripping process. the more movement that is performed the more cost there is.

in this research, the cargo movement is elaborated to analyze the costs that it creates based on the amount of movement. it is achieved that which movement gives the most proportion on a national scale logistics there fore based on the results a recommendation to revise the tariff can be made aiming to lower the logistic costs.
